The Ross McDonald Company offers these pictures to show display of our projects that have incorporated stack lighting.

Stack lighting takes intense coordination between the lighting design and the shelving system, such as the attachment of the system to the shelving, shelving heights, fixture lengths, electrical supply, etc. We are always pleased to address these issues with the architect during the design phase to avoid potential conflicts. We have architectural details of these solutions and would be happy to share these with the design community for projects in Northern California.

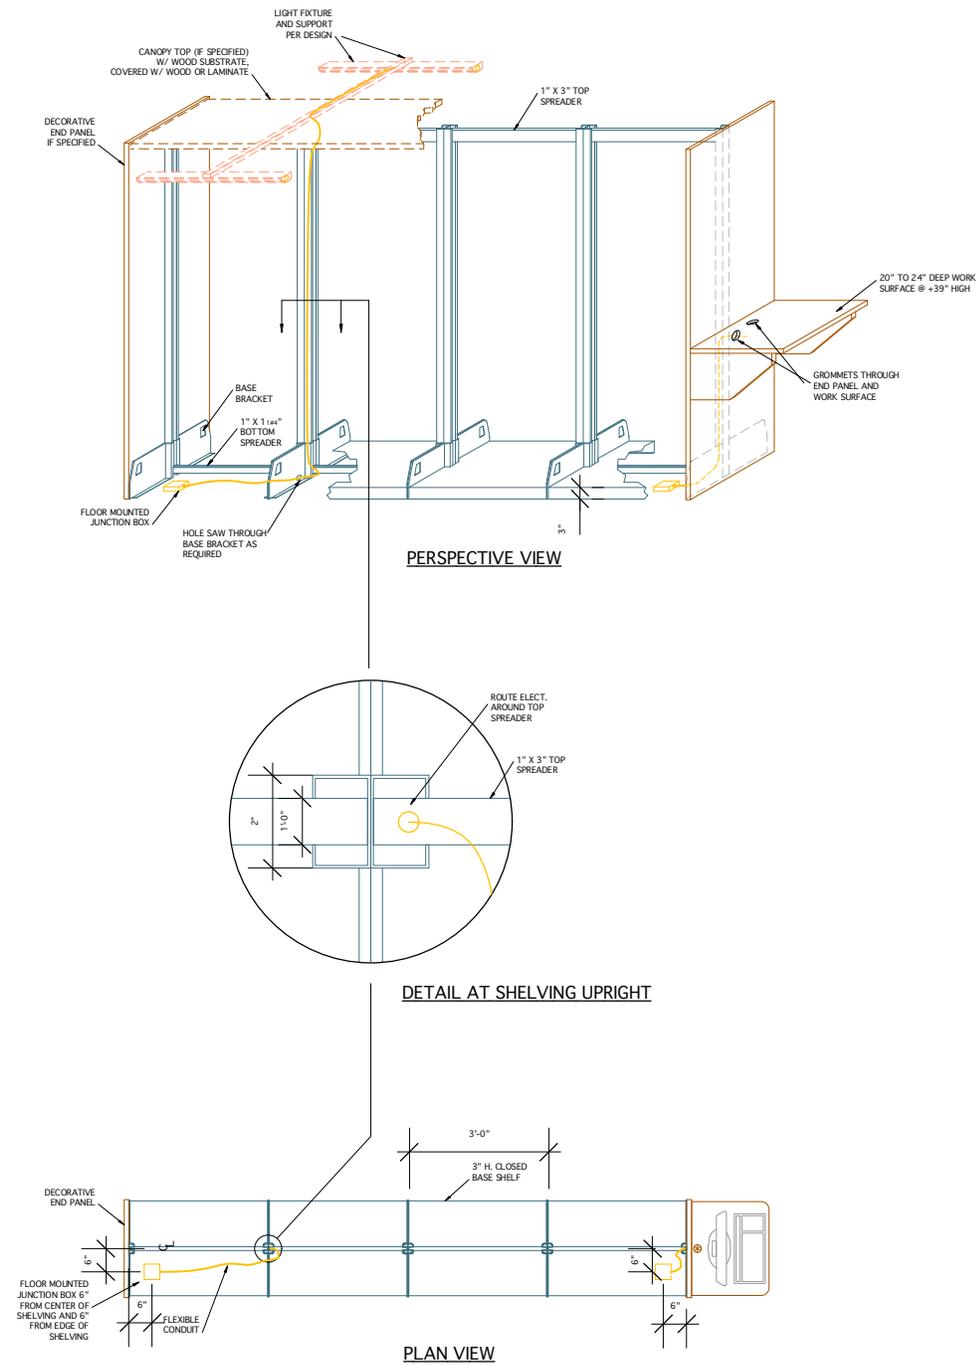

While many of the solutions shown are custom, there are pre-designed Stack Lighting Systems that work well and help alleviate the coordination. The stack lighting can be furnished by The Ross McDonald Company or by the electrical subcontractor.

Our 'optimum' scenario....

- \* The architect tells us they are putting lights on the shelving
- \* We send a PDF of some of our previous solutions
- \* They tell us which one they like
- \* We send details and make sure it all coordinates while we're detailing the shelving system

# Stack Lighting

## Generic Detail: Electrical routing through a shelving system from floor electrical to overhead lighting system
